# NEIGHBOUR CTF TRYHACKME-walkthrough

This CTF room teaches how to find and exploit an IDOR vulnerability using source code inspection and URL tampering.

Step 1:

The given URL took to a Login page.Here following as per said to click (ctrl+u) , page source code was opened .

Step2:

Here found a comment with some hidden credentials(guest:guest)Assuming it's the username and password.Again something about "admin" here.
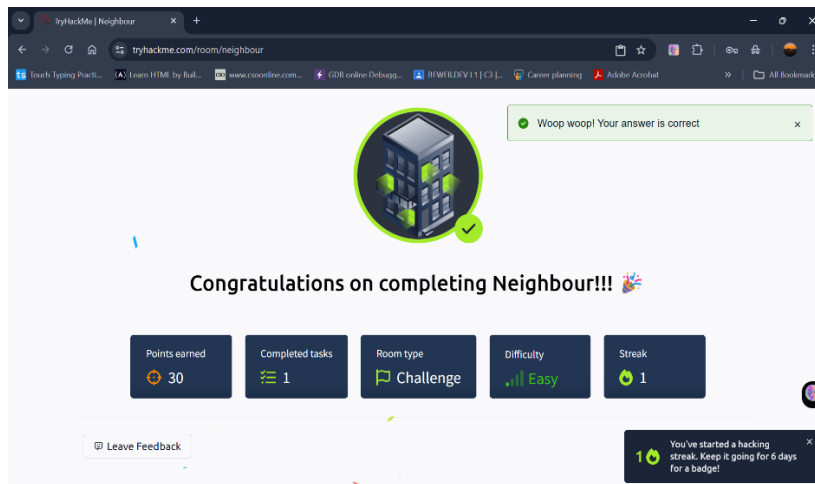

Step 3:Logged in as guest with the credentials we found first.In the address we realized user=?
gives the page.So latter we found username for admin as it is .so tried changing user to admin
Step 4:The URL in the addressbar , we changed user=admin from user=guest and yes we got
the flag .
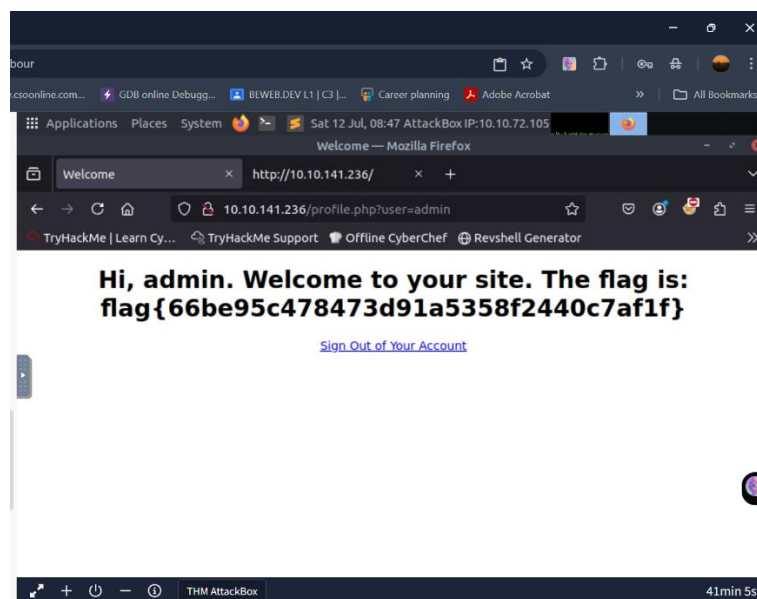

Step 5:

We have successfully found the flag and completed the room Neighbour on Tryhackme.
